A PARTNER YOU CAN DEPEND ON.

WHAT WE DO

Our grease trap cleaning and pumping services will help you to avoid unwanted backups and ensure your working environment runs smoothly. With our recommended maintenance schedule, you can feel confident that your grease traps are in compliance with all applicable regulations.

WHAT IS A GREASE TRAP?

Grease traps exist to intercept the fats, oils and greases generated from commercial kitchens, separating them from water that is returned to the city. As shown in the diagram, grease and oils float to the top, water flows through the outlet pipe and heavier particles sink to the bottom. Over time, the layers of grease and sediment build up and, if left unchecked, can block the water outlet or be forced into the city sewer system.

GREASE TRAP PUMPING & MAINTENANCE SERVICE

- > Trained to responsibly and efficiently provide full evacuation of your grease trap material during non-peak hours.
- > Frequency of service depends on size, volume and local ordinance specifications.
- > We work closely with local ordinances to determine a minimum service cycle and set up a preventative maintenance schedule to avoid unwanted backups.
- > Ensure removal of the sludge layer as well as the FOG layer at top of trap; over time the sludge will decompose giving off odor, and/or erode the trap, resulting in costly repair and improper function. Inspection of other potential issues also taken note.
- > We maintain complete records of grease trap service and make those readily available.
- > We educate our customers and employees on proper grease trap maintenance to prevent issues, including clogged inbound and out-bound drain lines.
